

Introduction

Verestro IBAN Management Service was created for Customers who want to provide their endusers the possibility to pay by IBAN. This solution allows Customer's endusers to top up their balances via a bank transfer and to make transfers from bank to bank account. As part of the integration, it is also possible to create an Admin Panel for the Customer. Admin Panel allows Customer to track the history of transfers made using the IBAN Management solution.

The solution is available to Customers integrated with Antaca. For more information about Antaca service please open [this link](#)

How to connect with us?

Verestro provides access to the solution in in two ways, depending on the Customer requirements. The Customer can access the IBAN Management solution through Mobile SDK or REST API implementation models.

Mobile SDK

Verestro provides an integration model that allows Customers to get and show generated IBANs on the mobile applications. Methods in this integration model are secured with an authorization token from Mobile DC. More detailed information about the integration with IBAN Management for mobile are available in Technical documentation chapter. Verestro actively supports the Customer in the integration process.

REST API

Verestro provides an integration model that allows Customers to get and show generated IBAN's through server to server connection. Methods in this integration model requires x509 certificate authentication. More detailed information about IBAN Management API integration are available in Technical documentation chapter. Verestro actively supports the Customer in the integration process
